

Care of the Elderly 2: Secondary Care

With the UK's rapidly aging population, healthcare professionals within the NHS are facing an increasing number of complex health conditions relating to the health and care of elderly people. The more common conditions affecting older patients are cardiovascular disease, dementia, Alzheimer's, diabetes, and cancer. Frailty is also a major issue with the increase in the number of bone fractures resulting from falls and accidents. We have provided a list of relevant articles from MA Healthcare

journals dealing with these areas, thereby providing your NHS staff with research, information and tips that will support both their work and the care of their patients.
